

Employee Attendance & Leave Dashboard

Problem Statement -:

The HR department has a large amount of employee attendance data. It is difficult to track attendance, absenteeism, and leaves manually. It becomes hard to understand employee productivity and attendance patterns.

Objective -:

The main objective of this project is to analyze employee attendance data using Power BI. This project helps to track attendance percentage, leave patterns, and absenteeism across departments. It also helps HR to monitor employee productivity effectively.

Purpose / Client requirements - :

The client requirements are as follows:

- i. Attendance Percentage
- ii. Leave Trend Analysis
- iii. Department-wise Absenteeism
- iv. KPI Cards (Attendance Count, Leave Count, Absent Count)
- v. Matrix Table with Conditional Formatting
- vi. Interactive Filters (Department, Status)

Dashboard -:

1. “Attendance Percentage” chart is a Bar Chart created using Department and Attendance %. IT and Finance departments have highest attendance , while Sales and HR are slightly lower.
2. “Department-wise Absenteeism” chart is a Column Chart showing absence percentage across departments.

HR and Finance have higher absenteeism , while IT has the lowest .

3. “Leave Trend Analysis” chart is a Line Chart showing monthly leave percentage.

Leaves are higher in March–May and gradually decrease, with lowest in November.

4. “Status Distribution” is shown using a Donut Chart.

Present: 72.8% (highest)

Absent: 17.2%

Leave: 10%

This gives a clear overview of employee attendance behavior.

5. “Matrix Table” displays department-wise values:

- Finance: Leave (8), Absent (14), Attendance % (50)
- HR: Leave (7), Absent (12), Attendance % (42)
- Sales: Leave (4), Absent (9), Attendance % (40)
- IT: Leave (6), Absent (8), Attendance % (50)

This helps in detailed comparison.

6. KPI Cards provide quick summary:

- Total Attendance Count: 182
- Total Leave Count: 25
- Total Absent Count: 43

7. Filters (Department & Status) allow users to interact with dashboard and analyze specific data easily.

Solved Problems -:

1. Calculated overall attendance percentage of employees.
2. Identified leave trends across months.
3. Analyzed department-wise absenteeism.

4. Compared attendance performance between departments.
5. Provided quick insights using KPI cards.
6. Used donut chart to understand employee status distribution.
7. Applied matrix table for detailed data analysis.
8. Made dashboard interactive using filters (Department & Status).

Conclusion -:

The dashboard provides a clear and interactive view of employee attendance data.

Most employees are present (72.8%), showing good overall attendance.

HR and Finance departments have higher absenteeism compared to others.

Leave trends show higher leaves at the beginning of the year.

This dashboard helps HR to monitor attendance, identify issues, and improve employee productivity.
